Chapter 1

Propositional Logic

1.1 Propositions & Connectives

Definition 1.1 (Proposition).

A proposition is a sentence (in our language) that has one (and only one) definite, consistent truth value.

Definition 1.2 (Negation).

Given a proposition p, the negation of p is denoted $\neg p$ and can be defined by the following truth table:

p	$\neg p$
Т	1
1	Т

Definition 1.3 (Conjunction).

Given two propositions p and q, the *conjunction* of p with q is denoted $p \land q$ and can be defined by the following truth table:

p	q	$p \wedge q$
Т	\top	Т
Т	\perp	
1	Т	
	_	1

Definition 1.4 (Disjunction).

Given two propositions p and q, the disjunction of p with q is denoted $p \vee q$ and can be defined by the following truth table:

p	q	$p \lor q$
Т	Т	Т
Т	\perp	Т
1	Т	Т
	\perp	

Some possible readings of $\neg p$:

- · Not p.
- \cdot p does not hold.
- · It is not the case that p.
- · We do not have that p.

Some possible readings of $p \wedge q$:

- $\cdot p$, and q.
- $\cdot p$, but q.
- · p; also, q.
- $\cdot p$; further, q.
- · In addition to p, we also have q.

Some possible readings of $p \vee q$:

- · p, or q.
- · Either p, or q.

Definition 1.5 (Material Implication).

Given two propositions p and q, the *conditional* formed by assuming p and concluding q is denoted $p \rightarrow q$ and can be defined by the following truth table:

p	q	p o q
Т	Т	Т
Т	_	1
上	Т	Т
	\perp	Т

Definition 1.6 (Material Equivalence).

Given two propositions p and q, the *biconditional* formed by p and q is denoted $p \leftrightarrow q$ and can be defined by the following truth table:

p	q	$p \leftrightarrow q$
Т	Т	Т
Т	\perp	1
	Т	
	\perp	Т

Some possible readings of $p \to q$:

- · If p, then q.
- $\cdot p \text{ implies } q.$
- · q is conditioned on p.
- \cdot q only if p.
- \cdot p is sufficient for q.
- · q is necessary for p.
- $\cdot q$ unless not p.
- · q or not p.

Some possible readings of $p \leftrightarrow q$:

- · p if and only if q.
- \cdot p is necessary and sufficient for q.
- · q is necessary and sufficient for p.

Definition 1.7 (Equivalence).

If we have two expressions φ and ψ in our formal language, consisting of some number of (possibly shared) propositional variables, connected together by logical connectives, then with the notation $\varphi \Leftrightarrow \psi$ we say that φ is equivalent to $\psi :\Leftrightarrow$ every assignment of truth values to the propositional variables of φ and ψ results in the same truth value for the two expressions.

Example 1.1.

Consider the two expressions $\varphi := p \to q$ and $\psi := \neg p \lor q$. We can see that φ has two propositional variables: p and q. ψ also has two propositional variables: the same p and the same q. If we construct the truth table for these two expressions, we will see that every assignment of truth values to p and q will result in $p \to q$ and $\neg p \lor q$ having the same truth value.

p	q	$p \rightarrow q$	$\neg p \vee q$
Т	Т	Т	Т
Т	_	Τ	Τ
上	Т	Т	Т
1	\perp	Т	Т

Definition 1.8 (Satisfiability).

A propositional expression φ consisting the propositional variables $p_1, \dots p_n$ is $satisfiable :\Leftrightarrow$ there exists an assignment of truth values to $p_1, \dots p_n$ that results in φ being equivalent to \top .

1.2 Boolean Algebras

Definition 1.9 (Boolean Algebra).

A Boolean algebra is a collection of terms B with two distinguished (and distinct) terms called \top and \bot , along with a unary operation called \neg and two binary operations called \land and \lor , such that the following statements are true for any terms p, q, r in B:

Axioms of a Boolean Algebra		
Identity	$\begin{array}{c} p \wedge \top \Leftrightarrow p \\ p \vee \bot \Leftrightarrow p \end{array}$	
Complement (a.k.a. Negation)	$\begin{array}{c} p \wedge \neg p \Leftrightarrow \bot \\ p \vee \neg p \Leftrightarrow \top \end{array}$	
Commutativity	$\begin{array}{c} p \wedge q \Leftrightarrow q \wedge p \\ p \vee q \Leftrightarrow q \vee p \end{array}$	
Associativity	$\begin{array}{c} p \wedge (q \wedge r) \Leftrightarrow (p \wedge q) \wedge r \\ p \vee (q \vee r) \Leftrightarrow (p \vee q) \vee r \end{array}$	
Distributive Laws	$ \begin{array}{c} p \wedge (q \vee r) \Leftrightarrow (p \wedge q) \vee (p \wedge r) \\ p \vee (q \wedge r) \Leftrightarrow (p \vee q) \wedge (p \vee r) \end{array} $	

This kind of structure is also referred to as a *complemented, distributive lattice*. Since we are establishing the algebra of *propositions*, our terms consist only of \top and \bot .

However, since none of these axioms tell us how to use the (very useful) symbols \rightarrow and \leftrightarrow , we need two additional axioms that will turn our Boolean algebra into an example of a *Heyting algebra*:

Heyting Axioms		
Conditional Disintegration $p \to q \Leftrightarrow \neg p \lor q$		
Biconditional Disintegration	$p \leftrightarrow q \Leftrightarrow (p \to q) \land (q \to p)$	

By referring to the truth tables, it should be easy to see that these axioms are truth preserving transformations, meaning that taking an expression like $p \land (q \to r)$ and applying an axiom like Identity to it does not change the truth value of the resulting expression $(p \land \top) \land (q \to r)$. For this reason, these are sometimes referred to as equivalence laws and many treatments of this subject prove these laws by referring to the truth tables.

For our purposes, we don't need to refer to the truth tables at all. The truth tables were a nice, intuitive, and compact way of defining the logical connectives, but we could just as easily have defined them by assuming that all of the axioms are true, without ever writing down a truth table. This provides a more *algebraic* approach to the study of logic, which is more in-line with the way logic is used to actually prove theorems in mathematics.

As such, while the while the truth tables provided a nice way of defining the logical connectives, we will be taking the algebraic approach by assuming the axioms of a Boolean algebra are true about our propositional logic and using them to prove theorems about our logical system.

Definition 1.10 (Tautology).

We say a proposition φ is a tautology \Leftrightarrow we have that $\varphi \Leftrightarrow \top$.

Definition 1.11 (Contradiction).

We say a proposition φ is a *contradiction* : \Leftrightarrow we have that $\varphi \Leftrightarrow \bot$.

Example 1.2.

 $p \vee \neg p$ is a tautology, and $p \wedge \neg p$ is a contradiction.

Theorem 1.1 (Uniqueness of Complements).

Let p be a term in a Boolean algebra (B, \neg, \wedge, \vee) . Suppose there were two terms x and y in the Boolean algebra such that

$$\begin{array}{ll} p \wedge x \Leftrightarrow \bot, & p \wedge y \Leftrightarrow \bot, \\ p \vee x \Leftrightarrow \top, & p \vee y \Leftrightarrow \top, \end{array}$$

meaning that x and y act like negations for p. Then, we have $x \Leftrightarrow y$.

Proof.

Let (B, \neg, \wedge, \vee) be a Boolean algebra and consider an arbitrary term p in the algebra. Suppose we have x and y satisfying the conditions given in the statement of the theorem above. Then, we can observe

$$\begin{array}{lll} x\Leftrightarrow \top\wedge x & \text{by Identity} \\ \Leftrightarrow (p\vee y)\wedge x & \text{by the assumption } p\vee y\Leftrightarrow \top \\ \Leftrightarrow (p\wedge x)\vee (y\wedge x) & \text{by Distributivity} \\ \Leftrightarrow \bot\vee (y\wedge x) & \text{by the assumption } p\wedge x\Leftrightarrow \bot \\ \Leftrightarrow y\wedge x & \text{by Identity.} \end{array}$$

Similarly, we can see that

$$\begin{array}{ll} y\Leftrightarrow \top\wedge y & \text{by Identity} \\ \Leftrightarrow (p\vee x)\wedge y & \text{by the assumption } p\vee x\Leftrightarrow \top \\ \Leftrightarrow (p\wedge y)\vee (x\wedge y) & \text{by Distributivity} \\ \Leftrightarrow \bot\vee (x\wedge y) & \text{by the assumption } p\wedge y\Leftrightarrow \bot \\ \Leftrightarrow x\wedge y & \text{by Identity.} \end{array}$$

So, from Commutativity, we can conclude that $x \Leftrightarrow (y \land x) \Leftrightarrow (x \land y) \Leftrightarrow y$.

Q.E.D.

Lemma 1.1.

For every Boolean algebra (B, \neg, \wedge, \vee) , we have

$$\neg \top \Leftrightarrow \bot$$
$$\neg \bot \Leftrightarrow \top.$$

Proof.

Let (B, \neg, \wedge, \vee) be a Boolean algebra with the distinguished terms \top and \bot . We will show that $\neg \top \Leftrightarrow \bot$ by showing that $\neg \top$ and \bot both act like negations for \top .

First, observe that $\neg \top \land \top \Leftrightarrow \bot$ by the Complement axiom. Similarly, we have $\neg \top \lor \top \Leftrightarrow \top$ by the Complement axiom.

Now, notice that $\bot \land \top \Leftrightarrow \bot$ by the Identity axiom. Similarly, we get $\bot \lor \top \Leftrightarrow \top \lor \bot \Leftrightarrow \bot$ by the Identity axiom (and Commutativity).

This shows us that $\neg \top$ and \bot are both negations for \top . Therefore, recalling that complements are unique by Theorem 1.1, we can conclude $\neg \top \Leftrightarrow \bot$.

Showing $\neg \bot \Leftrightarrow \top$ is left as an exercise to the reader.

Q.E.D.

Theorem 1.2 (Double Negation).

For any Boolean algebra (B, \neg, \wedge, \vee) and any term p in the algebra, we have $\neg \neg p \Leftrightarrow p$.

Proof.

Let (B, \neg, \wedge, \vee) be a Boolean algebra and consider an arbitrary term p in the algebra. We want to show that $\neg \neg p \Leftrightarrow p$, which we can do by establishing that p and $\neg \neg p$ are both complements of $\neg p$.

By the Complement axiom, we know $p \land \neg p \Leftrightarrow \bot$ and $p \lor \neg p \Leftrightarrow \top$, meaning that p is the complement of $\neg p$. Similarly, we can see that $\neg p \land \neg (\neg p) \Leftrightarrow \bot$ and $\neg p \lor \neg (\neg p) \Leftrightarrow \top$, showing us that $\neg \neg p$ is the complement of $\neg p$.

Since complements are unique, as seen in Theorem 1.1, and both p and $\neg \neg p$ are complements of $\neg p$, we can therefore conclude that $p \Leftrightarrow \neg \neg p$.

Q.E.D.

Theorem 1.3 (Idempotency).

For every Boolean algebra (B, \neg, \wedge, \vee) and every term p in the algebra, we have

$$p \land p \Leftrightarrow p$$
$$p \lor p \Leftrightarrow p.$$

Proof.

Let p be a term in an arbitrary Boolean algebra (B, \neg, \wedge, \vee) . Observe

$p \wedge p \Leftrightarrow (p \wedge p) \vee \bot$	by Identity	$p \lor p \Leftrightarrow (p \lor p) \land \top$	by Identity
$\Leftrightarrow (p \land p) \lor (p \land \neg p)$	by Complement	$\Leftrightarrow (p \lor p) \land (p \lor \neg p)$	by Complement
$\Leftrightarrow p \land (p \lor \neg p)$	by Distributivity	$\Leftrightarrow p \vee (p \wedge \neg p)$	by Distributivity
$\Leftrightarrow p \wedge \top$	by Complement	$\Leftrightarrow p \lor \bot$	by Complement
$\Leftrightarrow p$	by Identity,	$\Leftrightarrow p$	by Identity.

Therefore, $p \land p \Leftrightarrow p$ and $p \lor p \Leftrightarrow p$, as desired.

Q.E.D.

Theorem 1.4 (Domination).

For every Boolean algebra (B, \neg, \wedge, \vee) and every term p in the algebra, we have

$$p \land \bot \Leftrightarrow \bot$$

 $p \lor \top \Leftrightarrow \top$.

Proof.

Let p be a term in an arbitrary Boolean algebra (B, \neg, \wedge, \vee) . Observe

$p \land \bot \Leftrightarrow p \land (p \land \neg p)$	by Complement	$p \vee \top \Leftrightarrow p \vee (p \vee \neg p)$	by Complement
$\Leftrightarrow (p \land p) \land \neg p$	by Associativity	$\Leftrightarrow (p \lor p) \lor \neg p$	by Associativity
$\Leftrightarrow p \land \neg p$	by Idempotency	$\Leftrightarrow p \vee \neg p$	by Idempotency
$\Leftrightarrow \bot$	by Complement,	⇔⊤	by Complement.

Therefore, $p \land \bot \Leftrightarrow \bot$ and $p \lor \top \Leftrightarrow \top$.

Q.E.D.

Theorem 1.5 (Absorption).

For every Boolean algebra (B, \neg, \wedge, \vee) and any two terms p and q in the algebra, we have

$$p \land (p \lor q) \Leftrightarrow p$$
$$p \lor (p \land q) \Leftrightarrow q.$$

Proof.

Let p and q be terms in an arbitrary Boolean algebra (B, \neg, \wedge, \vee) . Observe

$$\begin{array}{lll} p \wedge (p \vee q) \Leftrightarrow (p \vee \bot) \wedge (p \vee q) & \text{by Identity} & p \vee (p \wedge q) \Leftrightarrow (p \wedge \top) \vee (p \wedge q) & \text{by Identity} \\ \Leftrightarrow p \vee (\bot \wedge q) & \text{by Distributivity} & \Leftrightarrow p \wedge (\top \vee q) & \text{by Distributivity} \\ \Leftrightarrow p & \text{by Identity}, & \Leftrightarrow p & \text{by Identity}. \end{array}$$

Therefore, $p \land (p \lor q) \Leftrightarrow p$ and $p \lor (p \land q) \Leftrightarrow q$.

Q.E.D.

Theorem 1.6 (De Morgan's Laws).

For every Boolean algebra (B, \neg, \land, \lor) and any two terms p and q in the algebra, we have

$$\neg (p \land q) \Leftrightarrow \neg p \lor \neg q$$
$$\neg (p \lor q) \Leftrightarrow \neg p \land \neg q.$$

Proof.

Let p and q be terms in an arbitrary Boolean algebra (B, \neg, \wedge, \vee) . Observe that

$$\begin{array}{lll} (p \wedge q) \wedge (\neg p \vee \neg q) \Leftrightarrow (q \wedge p) \wedge (\neg p \vee \neg q) & \text{by Commutativity} \\ \Leftrightarrow q \wedge (p \wedge (\neg p \vee \neg q)) & \text{by Associativity} \\ \Leftrightarrow q \wedge \left((p \wedge \neg p) \vee (p \wedge \neg q)\right) & \text{by Distributivity} \\ \Leftrightarrow q \wedge (\bot \vee (p \wedge \neg q)) & \text{by Complement} \\ \Leftrightarrow q \wedge (p \wedge \neg q) & \text{by Identity} \\ \Leftrightarrow q \wedge (\neg q \wedge p) & \text{by Commutativity} \\ \Leftrightarrow (q \wedge \neg q) \wedge p & \text{by Associativity} \\ \Leftrightarrow \bot \wedge p & \text{by Complement} \\ \Leftrightarrow \bot & \text{by Domination.} \end{array}$$

Further, we have

$$(p \land q) \lor (\neg p \lor \neg q) \Leftrightarrow (p \land q) \land (\neg q \lor \neg p) \qquad \text{by Commutativity}$$

$$\Leftrightarrow ((p \land q) \lor \neg q) \lor \neg p \qquad \text{by Associativity}$$

$$\Leftrightarrow ((p \lor \neg q) \land (q \lor \neg q)) \lor \neg p \qquad \text{by Distributivity}$$

$$\Leftrightarrow ((p \lor \neg q) \land \top) \lor \neg p \qquad \text{by Complement}$$

$$\Leftrightarrow (p \lor \neg q) \lor \neg p \qquad \text{by Identity}$$

$$\Leftrightarrow (\neg q \lor p) \lor \neg p \qquad \text{by Commutativity}$$

$$\Leftrightarrow \neg q \lor (p \lor \neg p) \qquad \text{by Associativity}$$

$$\Leftrightarrow \neg q \lor \top \qquad \text{by Complement}$$

$$\Leftrightarrow \neg T \qquad \text{by Complement}$$

$$\Leftrightarrow \neg D \lor \neg D \lor$$

So, we can see that $\neg p \lor \neg q$ is a complement for $p \land q$. Since complements are unique by Theorem 1.1, we can conclude that $\neg (p \land q) \Leftrightarrow \neg p \lor \neg q$.

Showing $\neg(p \lor q) \Leftrightarrow \neg p \land \neg q$ is left as an exercise to the reader.

Q.E.D.
